

Notes for Windows Forms. 5 important things to remember

1. Windows Form is a class which inherits from `System.Windows.Forms.Form`
2. Form controls can be added from Designer using ToolBox
3. Properties of Form & controls can be set from Properties windows
4. You can create your controls and set properties using code also.
5. When you use Designer, actually all it does is generates the code itself and hides it to avoid confusing programmers with too much code writing.

Notes for Web Forms. 5 important things to remember
